

Lab 10: Designing for the Web

Objective

The objective of this lab is to reflect on the current interface of the midterm assignment and make small improvements by applying the concepts introduced in the last class on **Information Architecture** and **Visual Design**.

Since the midterm assignment is approaching, the goal is not to redesign the entire application, but rather to critically evaluate the current design and, where useful, apply minor adjustments that can improve clarity, consistency, and usability.

Activity Description

1. **Evaluate the visual organization of the interface.** Check whether the most important elements are easy to identify, whether the layout supports the user's goals, and whether the interface feels consistent across the application.
2. Apply the concepts of **Visual Design** discussed in class to refine the graphic appearance of the application. In particular, select or review: (i) a coherent color palette; (ii) a readable and appropriate typographic font; and (iii) basic spacing, alignment, and visual hierarchy.
3. Make small adjustments to the existing interface where needed. These changes should improve the design **without requiring a complete redesign of the midterm assignment**.

NOTE: the purpose of this lab is to use Information Architecture and Visual Design principles to assess and improve the current interface. Focus on small, meaningful refinements rather than large structural changes.
